

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

530D 98001d

OFFICE OF
SOLID WASTE AND EMERGENCY
RESPONSE

Dear Colleague:

AUG - 6 1999

This letter transmits an *Errata* to the publication "*Human health Risk Assessment Protocol for Hazardous Waste Combustion Facilities*" (peer review draft, EPA530-D-98-001A, B & C) dated July 1998. In addition, it will serve to update you on the status of the protocol's finalization.

The risk assessment guidance became available for use via a Federal Register Notice on Friday, October 30, 1998. A public comment period was opened on that date as well. Since that time, the protocol has been used in a number of site-specific risk assessments on RCRA hazardous waste combustors. Additionally, a large number of comments were received through the public comment period. Consequently, this errata is a result of a combination of issues raised during implementation, as well as incorporation of relevant points which were raised during the comment period. We recommend that these corrections be used in conjunction with the protocol until the Office of Solid Waste is able to release a final protocol.

Please be aware, that due to the number and complexity of the comments received on the document, we still have a number of issues which have not been addressed by this errata. We are continuing to work through the unresolved issues at this time, but feel this interim measure is warranted to insure that any pending or future risk assessments have the advantage of this information. In addition, we will be sending the protocol (along with this errata) for an independent, exterior peer review within the next few months. We will address any outstanding public comments, as well as recommendations received from the peer review in a final document.

If you have any question or concerns on this matter, please contact Karen Pollard of my staff at (703) 308-3948 or Jeffrey Yurk of Region 6 at (214) 665-8309.

Sincerely;

A handwritten signature in cursive ink that appears to read "Karen S. Pollard" followed by "for".

Barnes Johnson, Director
Economics, Methods, and Risk Analysis Division

Enclosure

Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities (Peer Review Draft)

Errata - August 2, 1999

General Comments

Reference materials:

Numerous comments have been received challenging a number of physical/chemical parameters and toxicity values that are in the peer review draft version of the "*Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities*". Since this protocol is a "snap shot" of risk assessment science at the time of its publication, it is possible (even probable) that a number of the parameters and toxicity values and their reference materials have been updated and/or revised. Therefore, when using the protocol, the risk assessor should verify the information and references to determine if they are still valid. The Office of Solid Waste (OSW) will continue to review all reference materials used while finalizing the protocol and change those which we deem necessary. Until that time, however, we provide the list below of documents which have been revised or finalized and are not currently reflected in the protocol. These documents are:

1. "*The Determination of Acute Reference Exposure Levels for Airborne Toxicants*" (SRP Review Draft, October 1998). This is a document that has acute toxicity levels (RELS) which may be different than those currently reflected in the protocol. This document can be found on the web at www.oehha.ca.gov/scientific/acuterel.htm.
2. "*Soil Screening Guidance*" (publication 9355.4-23 July 1996). Currently, the protocol references a 1994 draft of this document. This document can be found at <http://www.epa.gov/oerrpage/superfund/resources/soil/toc.htm>
3. "*Superfund Chemical Data Matrix*" (publication 9345.1-21, EPA 540/R-96/028, June 1996). The data base can be down loaded from the OSWER web site at www.epa.gov/oerrpage/superfund/resources/scdm/index.htm.

Changes to Volume Two, Appendix A

NCEA provision toxicity values:

Please note, that a number of the toxicity values that have been changed in the table below reference a National Center for Exposure Assessment (NCEA) provisional number. The risk assessor should always check with their permitting authority on the validity and appropriateness of the provisional number prior to use.

Appendix A-3 COPC tables Revisions (August 1999):

Compound	CAS No	Parameter	Previous Value (July 1998)	Modified Value (May 1999)	Basis of Modification

Changes to Volume 3, Appendix B

Loss Due to Volatilization from soil (ksv):

The following equation should be used to update the soil loss due to volatiliztion equations in Appendix B, Table B-3-6. This change is based on the document entitled "*Methodology for Assessing Health Risks Associated with Multiple Exposure Pathways to Combustor Emissions* (U.S. EPA In Press). This will replace the ksv default of 0 which is currently recommended.

The soil loss constant due to volatilization (ksv) is based on gas equilibrium coefficients (Ke) and gas phase mass transfer (K_t). The first order decay constant, K_{sv}, is obtained by adapting the Hwang and Falco equation for soil vapor phase diffusion (Hwang and Falco, 1986).

$$ksv = Ke K_t$$

where:

- ksv = soil loss constant due to volatilization (yr⁻¹)
Ke = equilibrium coefficient (s/yr-cm)
K_t = gas phase mass transfer coefficient (cm/s)

The equilibrium coefficient (Ke) is calculated using the following equation:

$$K_e = \frac{3.1536E+7 H}{Z_s K_{oc} f_{oc} R T BD}$$

where:

K_e	= equilibrium coefficient (s/yr-cm)
$3.1536E+7$	= units conversion factor ([3.1536E+7 sec/yr])
H	= Henry's Law constant (atm-m ³ /mol)
Z_s	= soil mixing zone depth (cm)-- 1cm for untilled soil; 20 cm for tilled soil
K_{oc}^*	= organic carbon partition coefficient (mL/g)
f_{oc}^*	= fraction of organic carbon in soil (unitless)
R	= ideal gas constant (atm-m ³ /mol-K) - 8.205 E -05 atm-m ³ /mol-K
T_a	= temperature (K) - 298 K (ambient)
BD	= bulk density of soil (g/cm ³) - 1.5 g/cm ³

*Note: $K_{oc} \times f_{oc} = K_{ds}$ cm³/g - K_{ds} values are COPC-specific and provided in Appendix A

The gas-phase mass transfer coefficient (K_t) is based on general soil properties (Hillel, 1980; Miller and Gardiner, 1998) which can be used to calculate the following equation:

$$K_t = \frac{D_a \theta_v}{Z_s}$$

where:

K_t	=	gas phase mass transfer coefficient (cm/s)
Z_s	=	soil mixing depth (cm)
D_a	=	diffusion coefficient of contaminant in air (cm ² /s)
θ_v	=	soil void fraction (cm ³ /cm ³)

The soil void fraction (θ_v) is the volumetric fraction of a soil that does not contain solids or water.

$$\theta_v = 1 - \left(\frac{BD}{\rho_s} \right) - \theta_{sw}$$

where:

θ_v	=	soil void fraction (cm^3/cm^3)
θ_{sw}	=	volumetric soil water content ($\text{mL} (= \text{cm}^3)/\text{cm}^3$) – 0.2 mL/cm^3
BD	=	soil bulk density (g/cm^3) – 1.5 g/cm^3
ρ_s	=	solids particle density (g/cm^3) – 2.7 g/cm^3

The expression containing bulk density (BD) divided by solids particle density (ρ_s) gives the volume of soil occupied by pore space or voids (Miller and Gardiner, 1998). Soil bulk density is affected by the soil structure, such as looseness or compaction of the soil, depending on the water and clay content of the soil (Hillel 1980). A range of 0.83 to 1.84 was originally cited in Hoffman and Baes (1979). A default soil bulk density of 1.5 g/cm^3 is recommended in the HHRAP based on a mean value for loam soil from Carsel et al. (1988). Blake and Hartge (1996) and Hillel (1980) both suggests that the mean density of solid particles is about 2.7 gm/cm^3 . The soil water content depends on both the available water and the soil structure of a particular soil. Values for θ_{sw} range from 0.03 to 0.40 mL/cm^3 depending on soil type (Hoffman and Baes, 1979). The lower values are typical of sandy soils, which cannot retain much water; the higher values are typical of soils such as clay or loam soils which can retain water. A mid-point default value of 0.2 mL water/ cm^3 soil is recommended in the HHRAP. **Since the soil water content of soil is unique for each soil type, site-specific information is highly recommended.**

Air Density:

In Table B-3-8 of Appendix B the density of air (ρ) default value should be changed from 0.0012 to 1200. The change is the result of a units correction from g/cm^3 to g/m^3 .

Mercury:

The loading of COPCs to the water body caused by pervious runoff (L_R) and erosion (L_E) is

modeled by applying the equations in Table B-4-10 and Table B-4-11, respectively. These equations (as written) do not account for the increase in methylation that occurs as the divalent mercury fraction from pervious runoff and erosion enters the water body. Consequently, the following step are recommended.

To account for methylation of L_R (runoff load from pervious surfaces) entering the water body, values for $L_{R\text{ (Initial)}}$ are calculated for divalent mercury (Hg^{2+} - modeled as mercuric chloride) and methyl mercury (MHg) using their respective C_s and K_{ds} values as entered into the equation in Table B-4-10. Then, as indicated below, $L_{R\text{ (Initial)}}$ values should be apportioned based on an 85% Hg^{2+} and 15% MHg speciation split in the water body (consistent with Chapter 2 of the HHRAP) to obtain $L_{R\text{ (Final)}}$ values.

$$L_{R\text{ Hg}^{2+}\text{ (Final)}} = L_{R\text{ Hg}^{2+}\text{ (Initial)}} * 0.85$$

$$L_{R\text{ MHg}\text{ (Final)}} = L_{R\text{ MHg}\text{ (Initial)}} + (L_{R\text{ Hg}^{2+}\text{ (Initial)}} * 0.15)$$

To account for methylation of L_E (soil erosion load) entering the water body, values for $L_{E\text{ (Initial)}}$ are calculated for divalent mercury (Hg^{2+} - modeled as mercuric chloride) and methyl mercury (MHg) using their respective C_s and K_{ds} values as entered into the equation in Table B-4-11. Then, as indicated below, $L_{E\text{ (Initial)}}$ values can be apportioned based on an 85% Hg^{2+} and 15% MHg speciation split in the water body (consistent with Chapter 2 of the HHRAP) to obtain $L_{E\text{ (Final)}}$ values.

$$L_{E\text{ Hg}^{2+}\text{ (Final)}} = L_{E\text{ Hg}^{2+}\text{ (Initial)}} * 0.85$$

$$L_{E\text{ MHg}\text{ (Final)}} = L_{E\text{ MHg}\text{ (Initial)}} + (L_{E\text{ Hg}^{2+}\text{ (Initial)}} * 0.15)$$

After calculating species specific final L_R and L_E values, divalent and methyl mercury should continue to be modeled throughout Appendix B equations as individual COPCs.

Changes to Volume Three, Appendix C

COPC intake from soil:

In table C-1-1 of volume three, the soil consumption rate (CR_{soil}) for the adult and child should be changed to 0.0001kg/day and 0.0002 kg/day, respectively. These changes are based on the recommendation in the final draft of the *Exposure Factors Handbook* that a conservative estimate of the mean be used. The previous number was based on an earlier draft of the *Exposure Factors Handbook*, the new value reflects the recommendation made in the final draft.
